

ReFirme™ Skin Tightening

ReFirme™ combines safe levels of infrared light with bi-polar radio frequency to stimulate the production of collagen & promotes tightening of the skin. The outer layers of skin (the epidermis) are pre-cooled with the hand piece on the machine & the lower layers (the dermis) are pre-heated with infrared light. The combination of the two energies ensures a safe & effective treatment.

Who can be treated?

ReFirme™ is designed for men & women of all skin colors who have mild to moderate laxity of the face, neck & chest. If you have a sun burn you cannot be treated.

What can I expect from ReFirme™ treatments?

ReFirme™ can improve loose skin and sagginess of the face and neck. Skin texture can also be smoothed out by the tightening and firming effect of the treatment. This is a non-invasive procedure and most clients leave the clinic with only slight redness. You can return to normal activities immediately.

How does the treatment feel?

Most people feel a warming sensation or no discomfort during treatment and there is no recovery time. You may experience some flushing or redness of the skin for a short period of time or have no side effects from the treatment at all.

When will I see results?

You will notice some immediate tightening of the skin with gradual improvement as collagen production increases. You'll most likely need a series of sessions to achieve optimal results.

How long is the treatment program?

Each treatment takes about 45-60 minutes. Most people require 3-5 sessions at 3-4 week intervals. Follow-up treatments are recommended 1-2 times per year.
